

Fizyka - opis przedmiotu

Informacje ogólne	
Nazwa przedmiotu	Fizyka
Kod przedmiotu	13.2-WK-MATP-F-S18
Wydział	Wydział Matematyki, Informatyki i Ekonometrii
Kierunek	Mathematics
Profil	ogólnoakademicki
Rodzaj studiów	pierwszego stopnia z tyt. licencjata
Semestr rozpoczęcia	semestr zimowy 2018/2019

Informacje o przedmiocie	
Semestr	5
Liczba punktów ECTS do zdobycia	5
Typ przedmiotu	obieralny
Język nauczania	polski
Sylabus opracował	dr hab. Maria Przybylska, prof. UZ

Formy zajęć					
Forma zajęć	Liczba godzin w semestrze (stacjonarne)	Liczba godzin w tygodniu (stacjonarne)	Liczba godzin w semestrze (niestacjonarne)	Liczba godzin w tygodniu (niestacjonarne)	Forma zaliczenia
Wykład	30	2	-	-	Zaliczenie na ocenę
Ćwiczenia	30	2	-	-	Zaliczenie na ocenę

Cel przedmiotu

The aim of the lecture is to introduce students to the main branches of physics (classical mechanics, electrodynamics with elements of optics, quantum mechanics and theory of relativity) with special attention on mathematical apparatus used: differential geometry, variational calculus and algebra with elements of functional analysis. Students will be acquainted with the formalisms of various branches of physics. An additional goal is to educate students in the ability to formulate physical problems in the language of mathematics and to apply the mathematical formalisms to the description of selected physical and astronomical phenomena.

Wymagania wstępne

Foundations of mathematical analysis and linear algebra.

Zakres tematyczny

- Galilean space-time and Newton's law of dynamics
- Conservation laws
- Central forces and two body problem. Kepler's laws
- Constraints and generalized coordinates. The D'Alembert principle and the Lagrange equations. Tangential space and tangent bundle.
- Variation calculus and Hamilton's variational principle
- Noether theorem and conservation laws
- Phase space, cotangent bundle and Hamilton equations
- The symplectic structure of the phase space, the Poisson structure
- Maxwell equations, integral and differential formulations, special cases: electrostatics and magnetostatics, scalar potentials, Gauss's law
- Electromagnetic waves: derivation of the wave equation from Maxwell's equations
- Fermat's principle, the law of reflection and refraction, Huygens principle
- The energy of the electromagnetic field, the problem with the description of blackbody radiation and the birth of quantum mechanics
- Observables and states of classical and quantum systems, structure of C^* -algebras observables, observables and operators
- Probabilistic interpretation of the wave function
- Schrödinger's equation time-dependent and time-independent
- Spectra of operators and measurement results, Hermitian operators, expected operators' values.
- Commutative observables and simultaneous observability
- Non-commutative observables and uncertainty relations
- General properties of the wave function and its examples
- Representations of quantum states. Hilbert spaces. Representation of operators
- Galilean spacetime. The principle of Galileo's relativity. Einstein's postulates, Einstein's principle of relativity. Minkowski's spacetime
- Lorentz transformation and its consequences: velocity addition, constancy of the speed of light in various inertial systems, dilation of time, relativity of simultaneity, contraction of distance, paradoxes of twins and parking. The Lorentz and Poincaré groups
- The principles of general relativity: equivalence, relativity, minimal gravitational coupling and correspondence.
- Description of curved space-time: local coordinates, metrics, local inertial systems, light cones. Relations between spacetimes of special and general relativity.
- Curved spaces, Gaussian curvature of two-dimensional space, Egregium Gauss theorem, parallel transport of tangent vectors to curved two-dimensional spaces, curvature of higher-dimensional spaces.

26. Einstein's equations, mathematical formulation, interpretation and properties, physical and astronomical phenomena confirming the validity of the general theory of relativity.

Metody kształcenia

Traditional lecture, conversational and with discussion of certain problems

Class during which students, leaded by the teacher, solve exercises and discuss problems

Efekty uczenia się i metody weryfikacji osiągnięcia efektów uczenia się

Opis efektu	Symbole efektów	Metody weryfikacji	Forma zajęć
The student can explain the basic relativistic effects using the Lorentz transformation	•		- Wykład - Ćwiczenia
The student knows and understands the basic differences between the different spacetime models used in physical theories: Galileo, Minkowski and general relativity spacetimes	•		- Wykład - Ćwiczenia
The student can calculate the electrical potential for the simplest charge distributions using Gauss's law	•		- Wykład - Ćwiczenia
The student can isingle-handedly find necessary information in the professional literature	•		- Wykład - Ćwiczenia
The student knows the basic physical concepts used in particular branches of physics, physical laws expressed with their help and their mathematical formulations	•		- Wykład - Ćwiczenia
The student knows and understands postulates of the general theory of relativity. He knows and understands the theoretical and experimental circumstances that led Einstein to his postulates	•		- Wykład - Ćwiczenia
The student can write and solve the Schrödinger equation for the simplest systems, eg a particle bounded by infinite potential barriers	•		- Wykład - Ćwiczenia
The student knows physical and astronomical phenomena confirming the validity of the general theory of relativity	•		- Wykład - Ćwiczenia
The student can calculate the Lagrange and Hamilton functions and write in the explicit form the Lagrange equation of the second kind and the Hamilton equations for simple physical problems	•		- Wykład - Ćwiczenia

Warunki zaliczenia

Class

The final grade of the class is issued on the basis of points obtained from two written tests (with tasks of varying degrees of difficulty, allowing to check whether the student has achieved the effects of learning) and for active participation in classes.

Lecture.

The necessary condition of accede to the final test of the lecture is a positive evaluation of the class. The test consists of theoretical questions and short exercises to be solved and verifies the effects of learning in the areas of knowledge and skills. Obtaining 50% of points guarantees a positive grade.

he final grade is the arithmetic mean of those of the class and the lecture test.
