

# Mathematical analysis II - opis przedmiotu

| Informacje ogólne   |                                             |
|---------------------|---------------------------------------------|
| Nazwa przedmiotu    | Mathematical analysis II                    |
| Kod przedmiotu      | 11.1-WF-FizP-MA-II-S17                      |
| Wydział             | <a href="#">Wydział Fizyki i Astronomii</a> |
| Kierunek            | Fizyka                                      |
| Profil              | ogólnoakademicki                            |
| Rodzaj studiów      | pierwszego stopnia z tyt. licencjata        |
| Semestr rozpoczęcia | semestr zimowy 2018/2019                    |

| Informacje o przedmiocie        |             |
|---------------------------------|-------------|
| Semestr                         | 2           |
| Liczba punktów ECTS do zdobycia | 5           |
| Typ przedmiotu                  | obowiązkowy |
| Język nauczania                 | angielski   |
| Sylabus opracował               |             |

| Formy zajęć |                                         |                                        |                                            |                                           |                     |
|-------------|-----------------------------------------|----------------------------------------|--------------------------------------------|-------------------------------------------|---------------------|
| Forma zajęć | Liczba godzin w semestrze (stacjonarne) | Liczba godzin w tygodniu (stacjonarne) | Liczba godzin w semestrze (niestacjonarne) | Liczba godzin w tygodniu (niestacjonarne) | Forma zaliczenia    |
| Wykład      | 30                                      | 2                                      | -                                          | -                                         | Egzamin             |
| Ćwiczenia   | 45                                      | 3                                      | -                                          | -                                         | Zaliczenie na ocenę |

## Cel przedmiotu

Familiarize students with the advanced methods and potential abilities of classical analysis essential in further education.

## Wymagania wstępne

Mathematical analysis I, Algebraic and geometrical methods in physics

## Zakres tematyczny

- Partial Derivatives. Differentials in applications. Chain Rules for Functions of Several Variables. Directional Derivatives and Gradients. Tangent Planes and Normal Lines.
- Extreme values of functions of several Variables. Extreme values of functions defined on restricted domains. Implicit functions. Conditional extrema problems and the method of Lagrange multipliers. Applications in geometry and physics.
- Double integrals. Volume and surface area. Double integrals in polar coordinates. Moments and center of mass.
- Triple Integrals and its applications. Triple integrals in cylindrical and spherical coordinates. Change of variables and the Jabionan of a transformation.
- Line integrals and their applications. Conservative fields and independence of path. Geen’s theorem.
- Surface integrals and their applications. Gradients, divergence, curl as differential operators. Gauss’ divergence theorem and Stokes’ theorem.

## Metody kształcenia

The problem-solving lecture, a seminar lecture, the use of multimedia, demonstrating method. The discussion method classes, the problem-classical method, solving exercises illustrating the content of the lecture

## Efekty uczenia się i metody weryfikacji osiągnięcia efektów uczenia się

| Opis efektu                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Symbole efektów | Metody weryfikacji                                                                                                                  | Forma zajęć                                                 |

| 1. After completing the course a student is able to recognize, select and apply the classical theorems and methods of differential and integral calculus of severable variables - In finding extreme values of a function, in constrained optimization problems, - in geometrical problems such as measure properties of a solid, tangent plane and normal vector to a differentiable manifold, - and physical problems such as vector fields, work, conservative fields, interpretation of main differential operators 2. The student can apply the basics of probability theory in scientific investigation involving randomness 3. The student make use of variety of materials available in Polish as well as English resources 4. The student is able to present and confront his opinion and persuasion during discussion, analyzing and solving scientific problems in the classroom |                 | <ul style="list-style-type: none"><li>• dyskusja</li><li>• kolokwium</li><li>• obserwacja i ocena aktywności na zajęciach</li></ul> | <ul style="list-style-type: none"><li>• Ćwiczenia</li></ul> |

| Opis efektu                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Symbole efektów | Metody weryfikacji                                                                                           | Forma zajęć                                              |

## Warunki zaliczenia

### Class:

The grade consists of two criteria: the scores in four tests organized during classes (70%) and degree of active participation in classes and suitable preparation (30%). A student is required to obtain at least 50% of maximal score. The student with the lowest passing grade of 10% of maximal score may write a correction test before the exam class.

### Lecture:

The final exam is composed of written part. To be admitted to the exam a student must receive a credit for the class.

The course credit consists of the class grade (50%) and the exam grade (50%). The course credit is attained by positive passing both class and exam.
