

# Machine vision in robotics and automation - course description

| General information |                                                                                      |
|---------------------|--------------------------------------------------------------------------------------|
| Course name         | Machine vision in robotics and automation                                            |
| Course ID           | 11.9--AutD-MViRaA-Er                                                                 |
| Faculty             | <a href="#">Faculty of Computer Science, Electrical Engineering and Automatics</a> . |
| Field of study      | Automatic Control and Robotics / Computer Control Systems                            |
| Education profile   | academic                                                                             |
| Level of studies    | Second-cycle Erasmus programme                                                       |
| Beginning semester  | winter term 2022/2023                                                                |

| Course information  |                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------|
| Semester            | 2                                                                                            |
| ECTS credits to win | 4                                                                                            |
| Course type         | optional                                                                                     |
| Teaching language   | english                                                                                      |
| Author of syllabus  | <ul style="list-style-type: none"><li>dr hab. inż. Bartłomiej Sulikowski, prof. UZ</li></ul> |

| Classes forms  |                                |                            |                                |                            |                    |
|----------------|--------------------------------|----------------------------|--------------------------------|----------------------------|--------------------|
| The class form | Hours per semester (full-time) | Hours per week (full-time) | Hours per semester (part-time) | Hours per week (part-time) | Form of assignment |
| Laboratory     | 30                             | 2                          | -                              | -                          | Credit with grade  |
| Lecture        | 15                             | 1                          | -                              | -                          | Credit with grade  |

## Aim of the course

- Familiarize students with the successive stages of the vision system (from the acquisition process to the result of the classification algorithm)
- Develop the ability to use the vision system, configure its basic parameters and use information from the system in the robot control.

## Prerequisites

Basics of Robotics, Digital Signal Processing, Decision Supporting Systems

## Scope

Characteristics and architecture of the video system. Camera Configurations: "Eye in the hand" and "Eye off the hand". Basic parameters of the vision system. Potential applications. Challenges and problems. Integration of the vision system with executive devices (robots). Standard tasks (pick and place, quality control, etc).

Optics: lens construction, lens parameters: focal length, brightness, aberrations, distortion, vignetting. Focusing methods. Depth of field.

Acquisition of images. Range of visible light, infrared and ultraviolet bands. Photosensitivity. Parameters of sensors (resolution, dimensions and proportions). CMOS, CCD and others sensors. RGGB filters (Bayer mesh). ISO sensitivity. Exposition.

Backlighting systems: "backlight", "light-field", "diffuse-light" (axial diffuse-light). Operating modes: continuous and triggered.

Image transmission standards and protocols.

Digital representation of the image. Image file formats: RAW, TIF and JPEG. Lossy and lossless representation. Color models: RGB, CMYK, HSV, xyz and others. Conversions between color models.

Image processing. Histogram operations (normalization, alignment, stretching). Noncontext operations: arithmetic, non-linear (gamma correction). Contextual operations (filtration): lowpass filters (averaging, smoothing), high pass (sharpening, directional, detecting edges), median filter. Application 2D Fourier transform in image processing.

Morphological operations. Erosion and dilation. Closing and opening. Hit Or Miss, Top-Hat, Bottom-Hat operations. Edge extraction. Skeletonization. Morphological operations for images in shades of gray.

Methods of object segmentation. Recall. Otsu algorithm.

Basics of extraction and selection of features of objects. Basic pattern recognition methods. Template matching method.

Calibration of the camera. Location and orientation of the camera in the robot base layout.

Control of the industrial manipulator using information from the video system.

## Teaching methods

**Lecture:** conventional lecture, discussion

**Laboratory:** laboratory exercises

# Learning outcomes and methods of theirs verification

| Outcome description                                                                                                            | Outcome symbols | Methods of verification                                                                                                                       | The class form                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| Student can perform basic operations related to image processing (from pre-processing to simple pattern recognition algorithm) |                 | <ul style="list-style-type: none"><li>• activity during the classes</li><li>• an evaluation test</li></ul>                                    | <ul style="list-style-type: none"><li>• Lecture</li><li>• Laboratory</li></ul> |
| Student is able to describe the impact of information coming out of the vision system on robot control                         |                 | <ul style="list-style-type: none"><li>• an evaluation test</li></ul>                                                                          | <ul style="list-style-type: none"><li>• Lecture</li></ul>                      |
| Student can configure and safely use a simple vision system                                                                    |                 | <ul style="list-style-type: none"><li>• an evaluation test</li><li>• an observation and evaluation of activities during the classes</li></ul> | <ul style="list-style-type: none"><li>• Lecture</li><li>• Laboratory</li></ul> |
| Student can characterize the vision system parameters                                                                          |                 | <ul style="list-style-type: none"><li>• an evaluation test</li></ul>                                                                          | <ul style="list-style-type: none"><li>• Lecture</li><li>• Laboratory</li></ul> |
| Student knows and understands the impact of camera settings on the acquisition process                                         |                 | <ul style="list-style-type: none"><li>• an evaluation test</li></ul>                                                                          | <ul style="list-style-type: none"><li>• Lecture</li><li>• Laboratory</li></ul> |
| Student can name and briefly characterize the successive stages of image processing                                            |                 | <ul style="list-style-type: none"><li>• an evaluation test</li></ul>                                                                          | <ul style="list-style-type: none"><li>• Lecture</li></ul>                      |

## Assignment conditions

**Lecture** – the main condition to get a pass is a sufficient number of positive evaluations of written or oral tests conducted at least once per semester.

**Laboratory** - the condition for passing is at least 80% from all laboratory exercises and obtaining positive grades from tests verifying the knowledge and skills acquired during the exercises .

Calculation of the final grade: lecture 50% + project 50%
