Applied statistical physics - opis przedmiotu

Informacje ogólne

Nazwa przedmiotu	Applied statistical physics
Kod przedmiotu	13.2-WF-FizD-ASP-S18
Wydział	Wydział Nauk Ścisłych i Przyrodniczych
Kierunek	WFiA - oferta ERASMUS
Profil	-
Rodzaj studiów	Program Erasmus
Semestr rozpoczęcia	semestr zimowy 2023/2024

Informacje o przedmiocie

Semestr	2
Liczba punktów ECTS do zdobycia	5
Typ przedmiotu	obowiązkowy
Język nauczania	angielski
Sylabus opracował	• prof. dr hab. Andrzej Drzewiński

Formy zajęć

Forma zajęć	Liczba godzin w semestrze (stacjonarne)	Liczba godzin w tygodniu (stacjonarne)	Liczba godzin w semestrze (niestacjonarne)	Liczba godzin w tygodniu (niestacjonarne)	Forma zaliczenia
Wykład	30	2	-	-	Zaliczenie na ocenę
Ćwiczenia	30	2	-	-	Zaliczenie na ocenę

Cel przedmiotu

Familiarize students with the development of concepts and methods related to the thermodynamics and statistical physics. Presentation of their applications to the description of equilibrium states and non-equilibrium states in physics, biology or sociology.

Wymagania wstępne

Student should attend the courses "Fundamentals of Physics 1 and 2" (the first-cycle studies in physics).

Zakres tematyczny

LECTURE:
- Introduction: microstates and macrostates, entropy and information, non-equilibrium and equilibrium systems, the principle of maximum entropy, entropic forces, intensive and extensive quantities, the ergodic hypothesis, non-ergodic systems in nature
- Cellular automata: various cell neighborhoods, evolution simulations, Schelling’s urban segregation model
- Kinetic theory of gases: reversible and irreversible processes, particle collisions and the state of equilibrium, Maxwell-Boltzmann distribution, an average energy per particle and temperature, the theorem of equipartition of energy
- Phenomenological thermodynamics: state functions, state equations, the laws of thermodynamics, the thermodynamic description of phase transitions, the role of the fluctuation and sky blue
- Classical statistical mechanics: the ergodic hypothesis, the microcanonical ensemble, the equation of state for an ideal gas and for real gas, the thermal bath and canonical ensemble, the equivalence of thermodynamic ensembles, elements of phase transitions and critical phenomena, the critical opalescence, critical exponents and universality, the Ising model
- Stochastic processes: Markov chains, equilibrium conditions, the Master equation, the diffusion equation

CLASS:
Probability: discrete and continuous probability distributions, the binomial distribution, the normal distribution, the Poisson distribution, the Central Limit Theorem, some applications in physics and everyday life
Cellular automata: between chaos and order (playing in “Life”), a Mexican wave, a falling sand simulation
Kinetic theory of gases: Boltzmann's H-theorem, the root-mean-square speed and temperature/pressure, the mean free path
Phenomenological thermodynamics: work and energy, thermodynamic processes, the Carnot cycle and heat pump, the Otto cycle, thermodynamics of elastic bodies
Classical statistical mechanics: the Gibbs paradox, thermodynamic potentials, a partition function and thermodynamical functions, paramagnetism and the Curie's law, the Ising model of human behavior
Stochastic processes: a random walk, the Master equation and Brownian motion, a particle in a gravitational field and the barometric equation

Metody kształcenia

Classes are in the form of lectures when the student is encouraged to ask questions. On the exercises, students analyze and solve problems with a teacher.

Efekty uczenia się i metody weryfikacji osiągania efektów uczenia się

Opis efektu	Symbole efektów	Metody weryfikacji	Forma zajęć
At the basic level, the student is able to determine for real systems the scope and method of problem analysis based on statistical physics methods		• obserwacja i ocena aktywności na zajęciach • test końcowy	• Wykład • Ćwiczenia
The student knows and can apply the principles of thermodynamics for qualitative and quantitative analysis of simple physical problems		• bieżąca kontrola na zajęciach • test końcowy	• Wykład • Ćwiczenia
The student knows the basics of statistical physics and is able to use them for qualitative and quantitative analysis of simple physical problems		• obserwacja i ocena aktywności na zajęciach • test końcowy	• Wykład • Ćwiczenia

Warunki zaliczenia

LECTURE:
The final test is conducted in writing. Student receives four issues to consider requiring the knowledge of the issues and ability to combine different phenomena. For each task, one can get from 0 to 5 points. Received a positive rating requires at least 8 points (a sufficient for 8-10.5 points, a plus sufficient for 11-13.5 points, a good 14-16, a plus good 16.5-18.5 points, a very good 19-20 points).
CLASS:
The final grade will be affected by the following factors:
- activity at classes (40%)
- the result of the final test (60%) that will be based on problems similar, but not identical, to the problems studied during the classes

The classes must be completed prior to the final test.
The lecture grade will comprise 60% of the final grade while the class grade will comprise 40% of the final grade.
